The Augmented Library: Motivating STEM Students

Abstract

A review of first-year Computing and Gaming Technology students undertaking Personal Development Planning as part of a key year one module showed a lack of engagement (and submission of work). Research shows STEM students traditionally spend little time in formal library settings, and thus lack knowledge of the process of research. This work is focused on encouraging students’ transition from their online ‘persona’ in multiple contexts to ‘becoming’ a student. Taking a radically different approach to the sessions, the students, in small groups, were tasked with co-creating library artefacts through the medium of Augmented Reality. Weekly classes were ‘flipped’ and used for feedback, discussion, and exposure to research in action, where they became part of, and embodied within the research process. Our findings show significant and enhanced engagement with the learning process, and higher coursework submission rates.

Introduction

Problems with PDP

The motivation for this work was to energise the weekly one-hour Personal Development Portfolio (PDP) sessions included as part of the first year module Computing and Gaming Technology (CGT), and delivering basic academic skills and orientation to our University procedures. The traditional format relied on documents, which were used for discussion in class, but were not associated with any practical sessions. Student feedback and review by the staff indicated that the students did not value the PDP element. This resonated with research that indicates a lack of employability and soft skills in recent STEM (i.e. Science, Technology, Engineering, and Mathematics) subject graduates (CBI/Pearson, 2013; Harris, 2014; UKCES, 2014).

Brown et al. (2008) had successfully used the virtual world, Second Life, as a focus for developing group work. We hoped, therefore, that by introducing a small project, the CGT students would gain experience in skills such as group work, time planning, report writing, presentation, literature research, academic referencing, and critical reflection.

The assessment for the whole PDP section is ‘pass / fail’ and the only requirement is that students show ‘engagement’ (as judged by the tutor) with the topics. The advantage is that the topics are not assessed for content as showing engagement is the means to a pass / fail mark, allowing the students to engage with the topics without the fear of their project work being assessed. The disadvantage is that the workload assigned to the PDP project had to be very light as the PDP section is a small element of the overall module grade.

Augmented Reality in Education

Augmented Reality (AR) has been used in education as a way of presenting content in a novel context (Yuen, 2011). Wu et al. provide an overview of the features and affordances of AR:

... enhanced learning experiences by using 3D synthetic objects for students to interact with... A pervasive or mobile-AR system could enable ubiquitous, collaborative and situated learning enhanced by computer simulations, games, models, and virtual objects in real environments... AR and other immersive media for learning such as serious games and virtual worlds offer affordances of presence, immediacy, and immersion... Superimposing virtual objects or information onto physical objects or environments enables visualization of invisible concepts or events... AR has the potential to bridge the gap between learning in formal and informal settings (2013; pp. 43-44).

A typical augmented reality scenario is to link media (i.e. image / video / audio) to a real world object, viewed through the camera of a mobile device. The media is then ‘triggered’ to play by the object it has been attached to. The trigger occurs when the AR software recognises the object through the device camera and overlays the media onto the trigger image, thus creating an augmented image when viewed through the device.

One example of this is the HeartCam app (Mechanism Digital, 2015), which uses a stylised heart image to trigger a realistic animation of a real beating heart in the chest cavity. Our view is that while there are advantages to locating media triggers in the real world, students will gain more benefit from the ‘experiential learning’ (Kolb & Fry, 1975) opportunity to develop their own materials.

The research with the CGT students has been enhanced by the team delivering AR workshops in different learning contexts. Details of this and other related projects can be found at the team blog, Augmented@ARU, which also has instructions for getting started with Aurasma and links to other materials (Hobbs & Holley, 2015). For example, a group of 55 visiting teachers of English were supported in accessing broader vocabulary through AR, and an Anglia Ruskin schools project is using AR as a mechanism to unpack strategies for supporting good classroom behaviours as part of a series of CPD workshops.

The PDP AR Mini Project

The technology chosen for this project was the Aurasma AR creation app (Aurasma, 2015a), which was presented to students as the core technology to be used in a ‘mini’ project. The name given by Aurasma to the finished product of an image triggering an image / video / audio on the device screen is Aura:

[E]very image, object and even place can have its own “Aura”, which is our term for an augmented
reality experience! Through these Auras, magazines come to life with videos, adverts offer special
deals through web click-throughs and quizzes, catalogues launch 3D product models, and much
more (Aurasma, 2015b)

The students self-selected into small groups of between three and five members, and groups were asked
to create a name and logo, and to engage with the University Library, in the broadest sense, by producing
an AR aura. One or more students in each group downloaded the Aurasma app onto their smart phone or
tablet device and together they had to learn how to use it to create their auras. The students were
encouraged to plan, script, and storyboard their aura. Apart from asking them to observe the Intellectual
Property rights of images, videos and music, students were free to create their own media. Supporting
materials and ‘how to’ instructions were used to help scaffold and posted on the Virtual Learning
Environment (VLE). The weekly sessions were ‘flipped’, rather than a taught session they were used for
feedback, demonstrations, discussion and to guide the students to the supporting materials. Additional
support was offered through email, VLE discussion boards, and comments posted on the blog that
students used to report their progress.

The AR project offered a new way of working that created a more engaging programme as the focus for
the development of academic skills. Students were introduced to Aurasma and, working in groups outside
the class, they created team logos and worked on creating their auras. Students used the AR project as a
focus for research, referencing, group work, report writing, presentations, and blogging on the VLE.

Dr Debbie Holley conducted interviews with 40 of the students, drawn from three seminar groups self-
selected for video interviews in the class. The seminar tutors videoed the session, offering the whole
cohort insights into the research process being modelled in the class through the project team. This
activity was explained in detail to the students so that they were engaged in the research process as well
as being participants. This project was used as a case study for the students to develop their own practice
and reflect on their progression from a passive to a more active view of their role as students.

Results

Students Engagement with the AR Task
The students displayed a wide range of interpretations of the Library for the AR project. The Red
Squadron 1 group, for example, defined the Library by its physical space, while the Quack Attack group
deﬁned it by the content it contained. Both approaches are consistent with previous studies as they
provide learners with further understanding through the use of images (Eitel et al., 2013). Sommerauer
and Müller (2014) have shown that AR improves the learner’s memory; they studied museum visitors
attending an exhibition with a mixture of AR and non-AR exhibits and found that visitors retained the
information better when it was presented to them through AR. Similarly the NukeIn group used a maths
equation as an aura trigger to help others better understand a related equation. Helping users to grasp a
concept by supporting their cognitive processing through imagery (Ridley & Rogers, 2010), and giving
them a better chance at retaining the information (Sommerauer & Müller, 2014).

The students in the Blaze group chose to use the aura to review a book through a triggered video. This
approach fits with Chan’s (2008) notion that people’s opinions of a product are influenced by peer reviews.
The Blaze group’s approach could, for example, be extended to create review auras for books in the
Library. The students have shown high quality engagement with how to interact with the Library and
provided a range of useful AR ideas to promote the services offered.

A selection of the auras created by the students are presented in Table 1 for their applicability in a wide
context within the library and the learning process behind the auras.
<table>
<thead>
<tr>
<th>Group</th>
<th>Aura Created</th>
<th>Applicability and supporting literature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quack Attack</td>
<td>‘Sports in Society’ Book with weightlifting aura</td>
<td>This group provided a quick summary of the book topic. This helps readers to focus on the relevant text and provides a scaffold for the learners’ cognitive processing. (Leopold, Sumfleth &amp; Leutner, 2013). This could aid those who cannot read very well or lack a sufficient attention span.</td>
</tr>
<tr>
<td>Button Bashers</td>
<td>Aura of Disney characters over course book</td>
<td>This is a fun animation which engages people with the book further. Hartel (2014) suggests that educators and students would benefit from a playful approach to information.</td>
</tr>
<tr>
<td>Blaze</td>
<td>Video clip of student talking about the book</td>
<td>This is useful for students to get a first-hand opinion on the book; Chan (2008) found that consumers’ buying habits are affected by the reviews they read from other consumers. This is especially effective for new products with few reviews (Hu, Liu &amp; Zhang, 2008).</td>
</tr>
<tr>
<td>Nukeln</td>
<td>Aura of mathematical calculations on book cover and a diagram on a page</td>
<td>This group chose to overlay maths equations to a book, the aura was triggered by a related diagram which required a maths equation to understand. Information can be retained easier through AR than non-AR (Sommerauer &amp; Müller, 2014).</td>
</tr>
<tr>
<td>Indoor House Cat</td>
<td>Logo triggers an image of the group participants</td>
<td>By triggering an image as the overlay you can display more detail as images have the potential ‘to encode large amounts of information’ (Ridley &amp; Rogers, 2010) such as a picture of the author or their Subject Librarian.</td>
</tr>
</tbody>
</table>
An interesting observation about this project as a whole is that, rather than focusing on perfecting the application of technology to create an immersive and engaging experience within the virtual world, this project has used the virtual to bring students to engage with the real world. Students experienced finding and using physical books in the real library as an alternative to their usual habit of searching online for information and resources (Sadeh, 2007). In doing so this may have given them a deeper perspective on accessing knowledge through physical media within the context of a dedicated, immersive, and engaging study space.

### Non-submission Rates of Assessment Elements

The PDP element is a small part of the core *Computer Gaming Technologies* module and student time is mostly focused on the lectures, classes and assessments for the main part of the module. Although students are aware that they have to pass the PDP element to pass the whole module, some students who made an attempt at the much larger and more difficult main assessment failed to submit work for the smaller and less challenging PDP element. Table 2 shows the rates of non-submission of the CGT assessment elements.

<table>
<thead>

<tr>
<td>2013/14</td>
<td>55</td>
<td>11</td>
<td>20.0</td>
</tr>
<tr>
<td>2014/15</td>
<td>78</td>
<td>18</td>
<td>23.1</td>
</tr>
</tbody>
</table>

Table 2: Non-submission of Assessment Elements

As Table 2 shows, in the 2013/14 academic year, a higher proportion of students failed to submit the PDP assessment (34.5%) than those who failed to submit the main assessment (20.0%). In the 2014/15 academic year, however, this position was reversed with more students failing to submit the main assessment (23.1%) than the PDP element (21.8%).

Proportionately, while there was a moderate increase in student failure to submit the main assessment, the fail-rate for submission for the PDP element decreased by 12.7%.
Conclusion

In conclusion, the non-submission rate for the PDP project decreased by 12.7% after engaging with the AR element of the project. The concept of the PDP project was alien to these students who are not used to working in this manner on their course. The students expressed the usefulness of this task and how working in small groups on their auras provided them with the opportunity to develop their communication skills and group working skills. The final blog post from the Button Bashers sums up the student response to the process:

Hello for the Final time....

Overall the work that we have done in regard to Augmented Reality has been interesting, and is something we can look back on with future study (Luke).

Being part of a group of hard-working individuals has been a good process as has developed personal skills:

- Time Management (being able to try and work out a time when we are all available to meet up as a group)
- Spoken Communication (being able to talk professionally and sensibly)

Admittedly there sometimes has been a lack in judgement and silliness at times but that also comes down to being able to keep a clear head and not get too stressed. Being able to act the fool sometimes can be a nice break (Simon).

- Critical reflection (Although trying to give feedback on OURSELVES can be hard, being part of a group, gives the opportunity to have feedback from how the rest of the group sees each other) (Melissa)
- Working with different skills (each member of our group also was able to bring something else to the table in regards to the work and personal development, be it programming experience in the past, work not necessarily related to computer gaming, or just mainly having a good general attitude and bonding ability to get work done

Overall, even though at the beginning this Personal Development Planning we thought was a waste of time, it has been able to give us the acknowledgement of our personal skills and our strengths and weaknesses.

The technology is a useful medium to promote discussion, enhance skills and support learning in areas of the curriculum Meyer and Land (2005) would term ‘troublesome knowledge’ – enabling learners to access these areas through working in small groups and creating an aura together, thus encouraging user-generated content (Krumm et al., 2008) – a far more powerful learning experience, we would argue, than traditional didactic methods.

This method of engagement is not limited to technology students, Aurasma is an Augmented Reality app that is easy to use and can be quickly learned by a range of students. There are implications beyond the classroom for this project, Augmented Reality can be used by a wider sector to encourage student engagement with the service.

Acknowledgements

This project is a joint venture between the University Library, the Department of Education and the Department of Computing and Technology. We would like to thank Anglia Learning & Teaching for funding this work.
